

# Hints from the Model Garage

A magnetic cabinet latch can be used to replace a broken glove-compartment lock. Screw the latch to the door frame and scrape paint off the inside of the door where it touches the magnet. The new latch may eliminate some rattles, too.

Cargo can be secured in a station wagon by fastening several sets of rifle-sling swivels to the sides and floor of the vehicle with sheet-metal screws. Used with several random lengths of web strap, almost anything can be safely tied down.

Protect an engine heater by plugging it into a short, fused extension line. Use No. 12 or 14 wire with a plug at one end and a rubber outlet at the other. Cut one leg of the cord and install a rubber socket to hold a 15-amp house fuse.

Opened seat belts can be kept from dangling out the door by threading the two outer belts through loops bent from heavy copper wire. Insert the loops in holes punched in the seat frame with an ice pick and bend the ends over.
