

# Hints from the Model Garage

---

**Your radiator cap** is less likely to be left unnoticed after the coolant has been checked if you paint it bright yellow. Paint the underside, too (but not the pressure seal), to make it conspicuous even if it is set aside upside down.

**A rubber mallet** is useful in two ways when you change a wheel: Place it under one of the other wheels as a safety chock to keep the car from rolling; when the job is done, pull it out by the handle to use it for driving on the hubcap.

---

**If a headlight burns out** on both filaments, you can temporarily connect a parking light to the headlight circuit to show oncoming drivers the width of your car. Switch wires at the junction block, usually located behind the grille.

**Windshield washer won't squirt?** First, be sure there's water in the reservoir. Then disconnect the tube at the washer nozzle and slip it over the discharge end. Operate the washer a few times to reverse-flush the nozzle and clear it.
