

## More Hints from the Model Garage

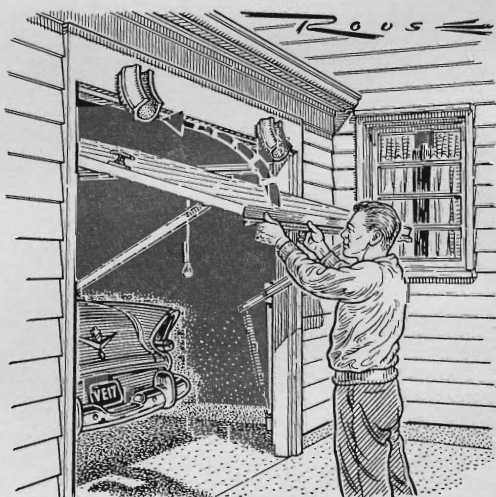

Ever blow your horn in vain to warn someone behind you that you're backing up? A junkyard horn bolted to the rear bumper bracket will blow in the right direction when you press a button on the dash. No horn relay is needed.

When hauling a trailer or carrying a load that makes the car tail heavy, aim the headlights down a bit to keep them on the road. Back off the vertical-adjustment screw exactly one turn so you can easily raise the beams for normal loading.

When you buy new tubeless tires, have the dealer snap in new valves as well. The old valves may have given good service through the life of the original tires, but age has taken the elasticity out of the rubber and weakened its seal on the rim.

An overhead door may jump the track when small children raise it and let it fly up against the stops. To prevent this, above the doorway nail two sections cut from an old tire. This will snub the door before the rollers hit the stops.
