Gus Gives Some Pointers on...

Winter Fuel Troubles

"Darned if it didn't bust right off like it was made out of mush!" Dick Carnaday muttered, as he glared wrathfully at the end of the copper gasoline pipe which had broken close to the carburetor connection. No gasoline was coming out of the supply side of the break, because the motor had stopped and the fuel pump was not working, but a slow stream dribbled from the piece of pipe left attached to the carburetor. The crisp morning air was heavy with the smell of gasoline.

"It's funny I can't seem to get a tight gas line on this bus," Carnaday observed to himself. "Maybe I'd better run down to the Model Garage and see if Gus Wilson has some copper tubing that's better than this rotten stuff."

Carnaday bound the broken ends of the pipe together with a piece of tire tape. Taking a wad of chewing gum out of his mouth, he smeared it over the binding and covered it with another layer of tape.

"There," he decided, "that ought to hold until I can get to Gus's place." A few minutes later he was blowing his horn before the door of the Model Garage.

"Howdy, Gus!" he replied to the veteran auto mechanic's smiling greeting, as the car came to a stop inside. "Got any copper gas-line tubing that won't break? What I've got on here now is junk."

"There's nothing wrong with this tubing," said Gus, after an examination. "It broke from crystallization because you didn't put it in right."

"What do you mean, I didn't put it in right?" Carnaday snapped. "I've fixed dozens of gas lines in my time and I never had any trouble like this before."

"You haven't put them in that way on any modern car, I'll bet," Gus maintained. "Motors in cars today aren't fastened tight to the frame the way the old ones used to be. Now they're mounted on rubber or springs to get rid of vibration. Every time you open the throttle, the motor gives a lurch in its mountings."

"It's lucky for you the gas pipe let go when it did. If it hadn't, you'd probably have got stuck at night miles from nowhere—and you'd be guessing yet what the trouble was!"

By MARTIN BUNN

Besides, there's a good deal of motor movement with respect to the frame, where you've fastened this pipe, every minute you're running. Copper isn't rubber and it won't stand bending and vibrating all the time.

"If you had cut that pipe fifteen or eighteen inches longer and put a five- or six-inch loop in it," Gus continued, "the loop would have had spring enough to take up the vibration and the tubing wouldn't have crystallized and broken off. How'd you come to put a new pipe in, anyway? This car isn't so old it should need one."

"I should have had sense enough to realize that was what was wrong," Carnaday growled. "Only I didn't know the motor moved so much. You can't see it move when you're driving and there's no motion you can see when it's idling. I suppose it really didn't need a new pipe."

Carnaday muttered as he slipped a rule from his pocket and started to measure for the copper tubing needed to install a new gas line.

"One of the connections was leaking a bit when I bought the car second-hand, and somebody had dented the pipe pretty bad at one spot, so I thought I'd just put in a new one while I was at it."

While Carnaday was speaking, Gus had been poking here and there about the motor. "How is she pulling on the hills?" he asked, straightening up again.

"Fine," Carnaday answered, enthusiastically. "The car's got more pep on the hills than I'll ever need. Only thing I noticed was that she sputtered a bit just as I got to the top of Blake Mountain this morning. That was just before the pipe broke, so I guess it must have been leaking so bad the carburetor didn't get enough gas."

"Maybe," Gus grunted, "but I'm saying it's lucky for you the gas pipe let go when it did. If it hadn't, you'd probably have got stuck miles from nowhere—and you'd be guessing yet what the trouble was."

"Why, what's wrong?" Carnaday asked, sticking his head under the hood and looking about anxiously.

"Same thing that happened to a brand-new car last week," Gus smiled. "Do you notice anything wrong with that fuel pump?"

Carnaday ran his fingers over the pipe connections. There appeared to be nothing wrong with them. "Do you think I've X-ray eyes?" he demanded. "How can I see what's wrong inside this pump?"

"There's nothing wrong inside," said Gus. "The pump itself is all right. The trouble is, the bolts holding it to the crankcase have loosened. The pump is moved up and down a little by the lever when the cam on the cam shaft turns over, instead of the pump staying still and the lever moving up and down. The movement is only a small one anyhow, and the spring that holds the lever against the cam is stiff—" (Continued on page 110)

so stiff that it holds the pump when you try to wiggle it to see if it’s loose. You can see the pump jiggling when it’s frozen. Naturally, when the motor stops the jiggles stops, too. So, by the time you get out to look at it, there’s nothing wrong to see!

“Sure I would have saved enough sure enough,” Carnaday agreed. “But it’s easy to see how to prevent that trouble from stopping you from the road...”

He got out a wrench and tightened them while Gus cut a new piece of copper tubing.

“WELL,” Carnaday went on, as Gus bent the new piece into shape, “modern cars bring modern troubles. It didn’t make any difference, in the old days, whether the vacuum tank was frozen or not, it still worked just the same.”

“Yeah, but think of all the troubles the vacuum tank had that you can’t have now,” Gus suggested. “Besides, there’s plenty of troubles with gas lines that we’ll always have with us. As an old-timer, you ought to know a lot of ‘em.”

“I should say I do!” Carnaday grinned reminiscently, as he held one end of the pipe while Gus bent the other end into a perfect fitting straight. “I guess as long as there’s pipes there’ll be dirt to clog them. Of course the gasoline is a lot cleaner now than it used to be, but some water in it never hurt then, but that don’t amount to anything.”

“Maybe it doesn’t go down South where you come from.” Gus chuckled. “But up here, in the middle north, like your old car morning and found they wouldn’t start at all. Mostly, they blame it on bad gas or poor ignition or a bum battery, when a lot of times it’s really just water frozen solid in the gas pipe or in the carburetor jets.”

“While you’re putting in this new pipe, why not put in an extra filter to take out the water?” I keep my car in an unheated garage, too,” Carnaday suggested. “The filter is just as cheap as the rest of it,” Gus explained. “How is any filter going to keep water from freezing in the line between the tank and the fuel pump—unless you put it right under the outlet of the carburetor? At least, when filtering the gas before it goes in the tank won’t keep water out of the tank. It could even freeze up the air that is drawn in as the gas is used.”

LOOK how those windows are covered

with moisture,” Gus went on, pointing to the nearest glass, which was covered with a film of water in tiny globules. “That always happens when it turns cold right after a warm, rainy spell. Suppose you put a screen in your garage some warm night and the tank is nearly empty so there’s a lot of air in it; then, during the day, it gets hot, and the cold, moist surfaces of the tank get drier, just like that window, and maybe as much as a tablespoonful of water settles to the bottom all day and gets into the lines?”

“Gosh!” exclaimed Carnaday. “There doesn’t seem to be any way to get around that.”

“You can’t,” Gus agreed, “but you can stop the chance for freeze-up just the same. All you need to do is drop a tablespoonful of denatured alcohol into the tank every few days, and especially after a sudden change to cold weather. If there isn’t enough water to cause any trouble, the alcohol will do no harm anyhow. If there is, it will mix with it and keep it from freezing.”

That sounds like a good idea,” Carnaday observed, as Gus (Continued on page 111)

(Continued from page 110)

finished installing the new pipe, “and I’m sure going to try it this winter. But what I want to know is, how do you get a car started when there’s water frozen in the gasoline line somewhere?”

“One way I know is to pour hot water over the carburetor—but be sure it doesn’t get in the air intake. Pour some more over the head and get the necessary leading to it, as well as the pipe leading back to the main tank as far as you can get at it. Heating the carburetor that way is old stuff, of course, it’s always been a good way to make starting easy in real cold weather.”

“What if the ice is farther back in the pipe near the tank?” Carnaday asked.

“In that case,” Gus suggested, “about the only thing to do is to crawl under and thaw the pipe with rags dipped in hot water. You’ll only have to work on the low spots in the pipe, because the water settles there.”

“Thanks for the dope, Gus,” Carnaday said, as he stepped on the starter while the mechanic watched to see if any signs of a leak appeared in the joints of the new pipe when the fuel pump began to force gas to the carburetor. “Guess you’ve covered all the things that are likely to keep gas from flowing, all right.”

“Except two,” grunted Gus, running his finger around each joint to make doubly sure there was no leak.

“Two more?” Carnaday questioned. “What are they?”

“One is a frozen air vent to the tank,” Gus replied. “Sleet, or even mud, can get around the filler cap so tight that it closes the vent that lets air into the tank and then you’re sure to stop. If the vent is a separate standpipe, moisture can collect in it and freeze, and the result will be the same.”

“I hadn’t thought of that,” Carnaday admitted. “And what’s the other?”

Gus smiled. “The most common trouble of all when the motor stops for lack of gas—and one that can fool even the expert, because he may not think to look for it—is an empty gasoline tank!”

USE OXYGEN INJECTION TO REPLACE BREATHING

Staying alive without breathing is a startling possibility suggested by recent experiments in England. In one test, a dog survived two-hour exposure in an artificial atmosphere devoid of oxygen, its life being preserved by injecting a stream of small oxygen bubbles through a hypodermic needle into an artery in the leg. The blood of the living animal was oxygenated or refreshed by direct contact with the oxygen, just as it normally would be by indirect contact with oxygen of the air through the membranes of the lungs. Further tests are expected to show whether injection of oxygen into the human blood would be of benefit in reviving persons near death from drowning, and in treating sufferers from lung diseases.

PROCESS SETS CONCRETE IN TWENTY MINUTES

A CONCRETE which sets so quickly that a man can put it on without leaving a trace twenty minutes after it is laid has recently been demonstrated. The concrete mixtures in general use require a far greater amount of water to obtain the necessary plasticity than is needed for the water’s chemical effect of hydration alone. Recognizing this fact, states the inventor, he has devised a simple and inexpensive process of removing the excess water quickly.

“RECEIVED your book, “Patent Protection,” an inventor, “and I am only sorry that I did not have the information contained therein some thirty years ago. I have been unfortunate enough through my ignorance to lose out in at least three major instances where understanding would have helped immeasurably.”

Every inventor should read one thing. Ignorance is dangerous, where Patent matters are concerned. The easiest way for an inventor to lose his rights, his possible profits is to do nothing because he doesn’t know WHAT TO DO. That is why inventors by the hundred have welcomed the books shown here. They tell them WHAT TO DO. Their facts are valuable, often vital. They may be the means of saving money, saving time, and most important, saving later disappointment.

Can You Answer these Questions?

How the Patent Laws protect an inventor? What is the first simple step to take to establish a claim to invention? What kind of a sketch or drawing is needed? When is a model needed? What can an inventor do to secure financial assistance? Why a Patent is necessary? What can be patented? What a competent Patent Attorney can do for you? What will it cost? What is the preliminary search and why it is important?

These and other questions are answered in our 64-page book of facts. “Patent Protection.” Also it shows interesting inventions, 118 mechanical movements, views of the U.S. Patent Office, and much more. We gladly send the book with our compliments to serious, interested men.

How We Help Inventors

For thirty-six years—more than a third of a century—It has been our business to help Inventors. We have represented THOUSANDS of men in their dealings with the U.S. Patent Office. We answer questions. We study each de- vice to bring out its best Patentable possibilities. We often dissuade inventors who might have gone ahead with inventions which could not possibly have been protected. By carefully developed methods, we try to keep expense as a minimum. We arrange deferred payments. A New Book About Selling Inventions

There are two sides to every inventive success: The inventive side and the commercial side. A good invention, poorly handled, can prove a failure commercially. An ordinary invention, properly handled, can be made a money-maker. In a NEW special booklet, just published, we give you some suggestions on “When and How to Sell an Invention”; practical hints on the commercial side of inventing. We will send this booklet FREE along with “Patent Protection.” Use handy coupon. Do that now, while you have it in mind.
